

WARDECKA, IRENA

Refractometric determination of admixture of salicylic acid in mixtures of binary systems. Katarzyna Kalinowski, Irena Wardzicka, and Edward Uscinowski (Zakl. Chem. Polon. Pharm. 13, 205-11(1958)(Eng. summary).—Quant. analysis of mixts. of binary systems by a refractometric method was investigated. Varying concns. of the substances were used as supplementary agent and distd. water is a solvent for Na salicylate + hexamethylenetetramine, Na salicylate + aminopyrine, Na salicylate + caffeine salicylate, and caffeine salicylate + aminopyrine. Fifty % EtOH was employed as a solvent for Na salicylate + aminopyrine, and caffeine salicylate + aminopyrine; 95% alc. was the solvent for acetylsalicylic acid + aminopyrine. Among these mixts. only the identification of Na salicylate + aminopyrine was not possible, primarily because of the too small difference in the  $n$  of these compds. The refractometric method is adequate for detg. mixts. of therapeutic compds.

WARDZYNSKI, W

The effect of ultraviolet irradiation on the absorption in the infrared region of potassium bromide and potassium iodide crystals with anionic impurities. W. Wardzynski (Polish: *Acta. Warsz.*, *Bull. Acad. Sci. Polon.*, *Classe III*, 1953, 10, 1-10 (1953) (in English)). Single crystals of KBr and KI were grown by the Kyropoulos method (C.A.B. 20, 2632). The max. added impurity was 0.01 mol. %. Two absorption bands were found for KBr( $\text{NO}_3$ ) crystals at 7.12 and 7.26  $\mu$ . Although the short-wave band has the greater intensity, the intensity ratio varies from crystal to crystal. The introduction of  $\text{K}^+$  to the melt gave rise to a 6.9  $\mu$  band and to 7.12 and 7.26  $\mu$  bands similar to those previously mentioned. The latter band was of insignificant intensity. The addition of  $\text{KOH}$  produced bands at 6.7, 7.0, and 7.1  $\mu$ , the last being of low intensity. A 7.1  $\mu$  band was concealed by the 7.0  $\mu$  band. Upon irradiation with the full light of a Hg lamp, of crystals of this type the intensity of the 7.12  $\mu$  band gradually decreased and that of the 7.26  $\mu$  band increased. It was found that these changes were produced by ultraviolet radiation. The changes appeared to be permanent, but after heating to 650° or higher, the 7.12  $\mu$  band was regenerated while the intensity of the 7.26  $\mu$  band was decreased. In the case of KI crystals into which no impurities were intentionally added, 6.8 and 7.12  $\mu$  bands appeared. Ultraviolet irradiation of KI caused the disappearance of the 7.12  $\mu$  band and an increase at 7.8  $\mu$ . Some coloration of the crystals resulted from the ultraviolet irradiation; however, this could be removed by exposure to white light or by moderate heating. The colored crystals and those bleached either by irradiation or moderate heating were characterized by identical absorption in the infrared. Thermal treatment of the crystals yielded absorption changes.

Title : Investigation of Infrared Absorption in Alkali Halide Crystals with Anionic Impurities.

Orig Pub : Acta phys. polon., 1958, 17, No 1, 29-61

Abstract : An investigation was made of the infrared absorption spectra of single crystals of KBr, KCl, and KI, containing impurities  $\text{KNO}_3$ ,  $\text{K}_2\text{CO}_3$ , and others in concentrations on the order of  $10^{-2}$  molar percent. It is shown that one of the bands experiences a change during rapid heating and cooling of the crystals, while others change when the crystals are illuminated with ultraviolet. A study was made of the change in the absorption of the specimens with temperature.

TITLE: Recombination radiation in GaSb

SOURCE: Przegląd elektroniki, no. 1, 1965. 29-34

TOPIC TAGS: gallium antimonide, recombination radiation, semiconductor laser, photoluminescence, electroluminescence, infrared radiation 21

ABSTRACT: The paper presents the preliminary results of an experimental investigation of photoluminescence and electroluminescence from a p-n junction in GaSb, made at the Katedra fizyki ciała stałego Uniwersytetu Warszawskiego (Solid-State Physics Department of Warsaw University) from the standpoint of using this material for semiconductor lasers. The method of obtaining pure GaSb (direct reaction in a graphite boat at 800C inside a quartz ampul filled with hydrogen under a few cm Hg pressure) is described. Final purification was obtained by zone refining (150 passes during 150 hours). The final material had a hole concentration of  $1.2-1.5 \times 10^{17} \text{ cm}^{-3}$  and a hole mobility of  $700-900 \text{ cm}^2 \text{ v}^{-1} \text{ sec}^{-1}$ . The material was then doped with Zn, Cd, S or oxygen; n-type material was obtained by doping with selenium and tellurium. The method of producing p-n junctions by alloying is described, and photographs of the junctions obtained are shown. 21

Card 1/AL

L 38155-65

ACCESSION NR: AP5005859

The system for the measurement of the relative intensity of photoluminescence is described in some detail; measurements were made using the pulse technique and a phase-type pulse detector. For the light source, a high-pressure dc mercury lamp was used. No results of the measurement of relative photoluminescence are given. The system for the measurement of electroluminescence is also described. Fig. 1 of the Enclosure shows the spectral distribution of electroluminescence for small current densities, both at room temperature and at 80K. Other studies showed that the intensity of electroluminescence increases exponentially with an increase in current density through the junction. Fig. 2 shows the spectral distribution of electroluminescence at the temperature of liquid nitrogen. The author concludes that the p-n junctions investigated represent an efficient, although low-power, point source of infrared radiation in the interval around 40 Mev, that can be easily modulated. 6150. ANALYSIS OF MULTIPLE SCLEROSIS CASES TREATED IN THE NEUROLOGICAL CLINIC, WARSAW (1951-1956) - Analiza przypadków stwardnienia rozsianego w Klinice Neurologicznej w latach 1951-56 - Warecka K. and Emeryk B. Klin. Neurol. A. M., Warszawa - WIAD. LEK. 1957, 10/21 (1001-1007) Tables 8

The paper is based on 289 cases of multiple sclerosis. The cases were analysed according to following aspects: sex, profession, age at time of onset, first neurological symptoms, the course of the illness, the clinical types, changes in the visual field and CSF, relation of the disease to pregnancy and hormonal disturbances, alcoholism and other noxious factors. Various therapeutic methods are discussed.

V 2820. Chemical determination of isoniazid in pleural exudate. W. Wareska. (Polski Tygod. Lekar., 1953, 8 (1), 1730; Referaty Zh. Khim., Biologicheskaya Khimiya, 1955, Abstr. No. 2354).—  
A method for the determination of isoniazid in pleural exudate is based on its reaction with  $\text{NH}_4\text{VO}_3$ . A sample of the exudate is centrifuged for 10 min. at 3000 r.p.m. with an equal volume of trichloroacetic acid, and 1 ml of a soln. of  $\text{NH}_4\text{VO}_3$  (0.25 g of  $\text{NH}_4\text{VO}_3$ , 20 ml of  $\text{N H}_2\text{SO}_4$ , and water to 100 ml) and 1 ml of water are added to 2 ml of the clear liquid. The extinction at 470 m $\mu$  is then measured. With isoniazid-free exudates, the extinction is insignificant. Exudates from patients treated with isoniazid contain 10 to 140 mg per 100 ml of isoniazid.

WARESKA, W.

✓ Determination of Isoniazid (INH) in pleural exudates.  
W. Wareska. *Polski Tygodnik Lekarski* 8, 1736(1953);  
~~Excerpt Med. Sect. II, 7, 1030(1961).~~ The detn. of Iso-  
niazid is based on the method of Wollenberg (*C.A.* 47, 40  
20874). The fluid is mixed with an equal vol. of 20%  
 $\text{CCl}_4\text{CO}_2\text{H}$  and centrifuged. To 2 ml. of the filtrate 1 ml.  
of reagent (50 mg.  $\text{NH}_4\text{vanadate}$  and 20 ml. of  $\text{N H}_2\text{SO}_4$   
dild. to 100 ml. with water) and 2 ml. of water are added.  
The extinction is read at 4700 Å. With concns. above 6  
mg./100 ml. the sample must be appropriately dild. before  
the reagent is added. A standard curve is plotted with  
pure Isoniazid. Maximal error is 2.5 mg. per 100 ml. at  
concns. of about 35 mg./100 ml. In exudates from patients  
receiving the drug, concns. ranging from 10 to 440 mg./100  
ml. were found. In patients not receiving the drug, neg-  
ligible extinctions only were obtained with the vanadate  
reagent.

ACCESSION NR: AP4027176

P/0061/63/000/004/0103/0109

AUTHOR: Warewicz, Stefan (Captain, Master in engineering)

TITLE: Possibility and applicability of employing vehicles travelling on an air cushion in ground forces

SOURCE: Przegląd wojsk lądowych, no. 4, 1963, 103-109

TOPIC TAGS: ground effect machine, air cushion vehicle, air-cushion supported vehicle, airbus, military vehicle, military transport vehicle

ABSTRACT: In order for carrying out assigned missions, contemporary armies have to be equipped with suitable ordnance and means of transport which will enable them to travel from point to point regardless of terrain features as well as combat and atmospheric conditions. Vehicles, which travel on a cushion of air, are of considerable interest in this connection. The chief advantages of these ground effect machines are: ability to traverse terrain which is inaccessible to other types of land vehicles; relatively low overpressure ( $0.01$  to  $0.03 \text{ kg/cm}^2$ ) acting on the ground surface; complete shock elimination; and independence of depth of water obstacles and rate of current flow. They are also independent of ice cover thickness on water. In addition, they have unlimited maneuvering ability in place and during low speed travel. Inasmuch as these vehicles have some of the features which are

Card 1/3

ACCESSION NR: AP4027176

characteristic of aircraft, helicopters especially, airfields and landing strips can be eliminated. A comparison of the airbus with a helicopter shows that their speeds are comparable (0 to 120 km/hr); they have unlimited mobility; they can fly at very low altitudes and under limited visibility conditions; ability to move in any direction; and ability to load and unload in inaccessible terrain. From a military point of view, the airbus is particularly suitable to reconnaissance units, inasmuch as they would not be restricted to roads. They can also be particularly adaptable as ambulances for evacuating casualties from the battlefield. Air platforms of 100-200 kg in weight could also be developed. These could be particularly suitable for evacuation and quartermaster purposes. Military planners are attempting to find ways of replacing helicopters, assault boats and various types of landing craft with airbuses in the case of amphibious landings. The big problem to overcome is the one of armor plating. This is of vital importance since some of these vehicles will be used directly on the battlefield. Armor plating will increase the weight, which will in turn increase the vehicle's size. This will be accompanied by a loss in mobility. Another problem is their ability to traverse terrain. It can be generally stated that ground effect machines are superior to wheeled vehicles on level terrain. They are not suitable for mountainous or even hilly terrain. In view of the diversified tasks which military transport vehicles

Card 2/3

ACCESSION NR: AP4027176

have to fulfill, the vehicles comprising the rolling equipment of any unit have to be as multipurpose as possible. It is quite possible that the best features of wheeled, tracked, and air-cushion vehicles will be combined into the design of future military vehicles. Orig. art. has: 1 figure.

Ten cases of tuberculosis of the tracheo-bronchial lymph nodes in adults are reported, and the clinical course of the disease is analysed. In all cases, the features of tuberculous toxæmia were present, and in the majority of the cases laboratory findings were abnormal. In 9 cases, treatment with INH was begun early; of these, in 4 cases marked radiological improvement was obtained. The opinion is held that tuberculosis of the tracheo-bronchial lymph nodes does not differ either in its clinical features or its course from tuberculosis of any other lymph nodes. Antimicrobial therapy brings about anatomical improvement provided it is applied early, before caseous lesions of the nodes have developed.

TITLE: Investigation of the high-voltage photoeffect in thin silicon films

SOURCE: Przegląd elektroniki, no. 1, 1966, 17-27

TOPIC TAGS: ~~silicon~~, photo emf, <sup>silicon</sup> semiconductor, photoelectromotive force, photoeffect, semiconducting film

ABSTRACT: The purpose of the present investigation of the high voltage photo emf effect in the thin films of certain semiconductors (in this study principally silicon films) was to determine the causes of this effect. Some of the results obtained are discussed and an attempt is made to explain them. The thin films were prepared by the thermal evaporation deposition on a hot bed of silicon in a  $10^{-4}$  mmHg vacuum, and the rate of silicon deposition was on the average about  $50 \text{ \AA}/\text{sec}$ , and the film thickness from 500 to  $1,000 \text{ \AA}$ . The effect of thermal treatment on the value of the photoelectric voltage, on the adsorption of gases on the film surfaces, and the effect of aging and stresses were also investigated. It is pointed out that the most probable causes discussed here of the high photoelectric voltage are rather complex

M.

Drobot, Stefan, and Warmus, Mieczyslaw. Dimensional analysis in sampling inspection of merchandise. Rozprawy Mat. 5, 54 pp. (1954). (Russian summary)  
The authors set up a "phenomenological" theory of sampling inspection which is not based on probabilistic arguments. The main tool of this theory is dimensional analysis, a brief account of which is given. A variance formula of the type  $\sigma^2_{\text{est}} = \sigma^2_1 + \sigma^2_2 + \dots$  is included among the postulates of the theory. The authors claim that important problems of sampling inspection can be solved in a simple way by their method. Unknown dimensionless constants occurring in the results obtained are assumed to be determined by suitable experiments. The analysis of the results of such experiments is assumed to be made by methods based on mathematical statistics.

WARNUK, MIECZYSŁAW

✓ \*Eukaszewicz, Józef; and Warnuk, Mieczysław. Metody numeryczne i graficzne. Część I. [Numerical and graphical methods. Part I.] Państwowe Wydawnictwo Naukowe, Warszawa, 1956. 429 pp. (1 plate). zł. 29.20.

*Mezh* This is a well-written text book on standard numerical and graphical methods which is suitable for a beginner who had no special training in the subject. The author's aim was to fill an obvious gap in the Polish mathematical literature. It does, nevertheless, contain the author's original contributions to the art of computing. Since there is an almost complete absence of references, these contributions are difficult to spot and to appraise. The book describes an interesting variant on matrix calculus developed by T. Banachiewicz, and called the "calculus of Cracovians" together with its application to the solution of systems of linear equations.

The emphasis is on procedures, rather than on proofs or discussion. Here is a list of topics: Theory of maximum error; Calculus of differences; Interpolation; Approximation; Algebraic equations; Linear equations and Cracovians; Numerical and graphical differentiation and integration; Co-ordinates and graphs; The slide-rule; Nomograms.

This useful booklet ends with a very modest set of tables and contains an Index.

*J. Kestin*

WARMUS, M.

Warmus, M. Calculus of approximations. Bull. Acad. Polon. Sci. Cl. III. 4 (1956), 253-259. *W*

A theory is developed for an arithmetic and calculus of approximate numbers. The author shows that a simple and natural theory based on defining the approximate number  $[a, A]$  as the closed interval  $a \leq x \leq A$  leads to a system in which the distributive law fails and in which subtraction is not the inverse of addition. If however we define the approximate number  $[a, A]$  to be the closed interval  $\min(a, A) \leq x \leq \max(a, A)$  a more symmetrical system results in which it is possible to define the rational operations in a satisfactory way. If we write

$$[a, A] = \frac{1}{2}(A + a) + \frac{j}{2}(A - a),$$

where  $j$  is an imaginary unit for which  $j^2 = -1$  the arithmetic and calculus of approximate numbers is equivalent to that of the so-called hyperbolic complex numbers. A monograph on the elaboration of this theory is promised.
